

## TB0008 SB360 Remote Control Units Series 1, 2 & 3

Date: 16/03/99

The early version Series 1 remote units were fitted to machine serial No SB4451-701 through to serial No 4710-724 and are identified by the round multi pin plug for the remote cable connection.

The series 2 remote units were fitted to machines serial No 4689-725 through to serial No 5594-929 and are identified by an oblong multi pin plug for the remote cable connection.

Series 3 remote units have been fitted from serial No 5598-930 onward to SB360, SB300 and SB330 units. These are identified by the wired in remote cable with a **"Female"** oblong plug on the cable end.

A Series 2C remote unit has been introduced as a replacement field units and is available in a complete assembly form with or without joysticks. This remote unit is based on the Series 3 units which have proved to be robust and more reliable than the Series 2 units.

The outward appearance is very similar to series 3 units in that they share the same basic components. The physical differences are the **"Male"** oblong plug on the cable end and two internal mounted relays which keep the unit compatible with the main control box Series 2 wiring and plug base connection. The remote box lid has a yellow band with "Series 2C only" written in black for identification.
